

What were your learning goals at the beginning of the unit?

I wanted to get a proper understanding of html and what files are necessary for a website to run.

Learn how to edit website efficiently and fast
learn about web development tools that may be useful in the future.

What have you learned?

Css, html, jQuery are all thing i have learnt and tried to familiarise myself with.

What obstacles have you found?

jQuery debugging challenges set codepen had me pulling my hair out and i didn't understand what the problems were. I gave up... I feel bad about giving up but want to focus on other parts of the project more in-depth.

How did you go about solving the problems you encountered?

Tutorials

Help from matteo and classmates when possible
self trial and error mostly.

What could you improve in your project?

Finish the debugging challenges and create more css and potentially add some jQuery to my recipe. Website is however running smoothly and only need content adding to.

What do you intend to improve in your personal and professional skills?

I feel collaboration would be a good improvement for me, i have difficulty working with other and get distracted easily. Time management is another large aspect that i could improve on for the future as i believe i could have completed everything if i had.

procrastination time could be reduced and that would also probably help me intensively.

Going to sleep earlier so i feel fresher in the morning for matteo's coding class would be a bonus for me.
